

Meridian Engineering — New Hire Onboarding

Getting access

New engineers request access through the Meridian IT desk. Standard access includes GitLab (the meridian-tech group), the GCP staging project, Opsgenie, and Slack. Production access is granted only after completing the security course and is approved by your team lead for 60 days at a time.

Local setup

Clone the meridian-tech/platform repository. Install Node.js 20 and the gcloud CLI. Run 'make dev-up' to start local Postgres, Redis, and RabbitMQ via docker-compose. Copy config.example.yaml to config.yaml and add your personal API keys. Run 'make check' to confirm the environment is healthy.

Team structure

Engineering has three teams. The Infrastructure team owns Kubernetes, CI/CD, and the Gateway Service. The Fleet team owns the Fleet Service and the Tracking Service. The Delivery team owns the Shipment Service and the Routing Service. The Director of Engineering is Sofia Aranda.

First week

In your first week, complete the security course, deploy one change to staging, and shadow an operations on-call shift. Your onboarding mentor is assigned on your first day. Post any questions in the #eng-onboarding Slack channel.
