

Meridian Operations — On-Call Runbook

Delayed shipments

When a shipment misses its promised delivery window, the Tracking Service emits a `shipment_delayed` event. The SLA Worker retries route recalculation up to 2 times, then flags the shipment as `at_risk`. If a shipment stays `at_risk` for more than 12 hours, it is escalated to the regional operations manager and the customer is notified by email.

Failed deliveries

A delivery can fail for three reasons: recipient absent, address invalid, or parcel damaged. Absent-recipient parcels are retried the next business day, up to 3 attempts, after which the parcel is returned to the origin depot. Damaged parcels are photographed and logged to the `claims_db` database, and a claim above 300 EUR requires approval from a Claims team lead.

Escalation

The operations on-call rotation is owned by the Fleet team. Primary on-call responds within 10 minutes during business hours. Page the on-call through Opsgenie service 'meridian-ops'. For a full Mapbox outage, disable live routing via the feature flag 'routing.live_enabled', fall back to cached routes, and notify the on-call lead, Marcus Feld, in the #ops-incidents Slack channel.

Key metrics

The operations dashboard tracks on-time delivery rate (target: above 94%), average scans per parcel, and `at_risk` shipment count. An alert fires if the on-time rate drops below 90% over any 60-minute window.
